

ABSTRACT

The present invention relates to a paint particularly for plastic materials, comprising one or more acrylic-based resins that can undergo cross linking by exposure to ultraviolet (UV) radiation, one or more photo-initiators to induce cross-linking of said acrylic resin (or more resins) in the presence of UV radiation, and one or more fillers. The invention further relates to a method for painting a substrate, such as the housings of cellphones, in which said paint is applied on the material and is made to undergo cross-linking by means of exposure to ultraviolet radiation.
